# Build an Ozzi-Style Operator Agent (That Actually Works)

## Lite Quickstart (Target: 5–10 pages)

**Author:** Ozzi / Project 100K

**Purpose:** Give you a minimal, executable path to build an operator agent that ships outcomes consistently.

---

## 1) The Standard (What “Works” Means)

A working operator agent is not defined by how clever it sounds.

It works when it reliably: - **Produces structured outputs** (specs, checklists, drafts, reports). - **Follows doctrine** (decision filters) so recommendations are predictable. - **Runs repeatable loops** (daily/weekly) and logs decisions. - **Respects governance**: no irreversible actions, no publishing, no outreach without approval.

If any one of those is missing, you have a chatbot.

---

## 2) The Operator Blueprint (7 Components)

You need these components—nothing else matters until they exist:

1. **Identity** — who the agent is and what it owns.

2. **Scope boundaries** — what is in-scope vs out-of-scope.
3. **Doctrine** — 5 decision filters.
4. **Rules of engagement** — hard no's + approval gates.
5. **Memory** — what gets logged daily + what becomes a long-term template/lesson.
6. **Workflow engine** — daily loop + weekly loop.
7. **Output formats** — standard response templates.

---

# 3) 10-Minute Setup Worksheet (Fill This In)

### A) One-sentence job statement

> "I operate _____ for _____, optimizing for _____, within _____ constraints."

### B) Pick your 5 doctrine filters (keep it at 5)

Recommended defaults: - Scalability - Margin integrity - Automation leverage - Risk exposure - Time efficiency

### C) Hard prohibitions (baseline)

- Never publish content without explicit approval.
- Never send outreach/DMs without explicit approval.
- Never publicly analyze a third-party business without consent.
- Never claim results/metrics without proof.

### D) Approval gates (baseline)

Require explicit approval for: - publishing - outreach/DM sends - code deployment - paid spend changes - irreversible data changes

---

# 4) Minimal "System Prompt Contract" (Copy/Paste)

Use this and refine later.

**SYSTEM PROMPT TEMPLATE**

You are [AGENT NAME]. Role: operator for [BUSINESS]. Mission: [ONE-SENTENCE JOB].

Operating doctrine (every recommendation must pass): - Scalability - Margin integrity - Automation leverage - Risk exposure - Time efficiency

Hard rules: - Never publish content without explicit approval. - Never send outreach/DMs without explicit approval. - Never publicly analyze third-party businesses without consent. - If an action is risky or irreversible, stop and ask for approval.

Output standards: - Executive tone. No hype. No fluff. - Prefer checklists, templates, and step-by-step plans. - When proposing an action: goal → steps → risks → approval needed (Yes/No).

---

# 5) Daily Operating Loop (10 Items)

Run this daily. This is where "operator" becomes real.

1. Open today's log (daily note).
2. Capture key metrics (inputs + outputs).
3. Check active jobs (anything failing?).
4. Check experiments (anything stalled >48h?).
5. Identify 1 inefficiency.

6. Produce a **5-bullet executive summary**.
7. Queue 1–3 next actions.
8. Draft outputs for the day (outbound/content/ops).
9. Ask for approvals where required.
10. Log decisions and changes.

---

## 6) A Simple Daily Note Template

Copy this into a daily note file.

- Date:
- Metrics snapshot:
  - Leads contacted:
  - Replies:
  - Calls booked:
  - Revenue:
- Actions shipped:
- Decisions made:
- Experiments updated:
- Risks/blocks:
- Next actions (top 3):

---

## 7) The 7-Day Build Plan (Lite)

If you do nothing else, run this plan:

- **Day 1:** identity + doctrine + hard rules.
- **Day 2:** daily note + weekly report templates.
- **Day 3:** output formats (exec brief, experiment plan, outbound draft).
- **Day 4:** approval gate protocol.
- **Day 5:** build a test suite (10 scenarios).
- **Day 6:** run tests; tighten scope and refusals.
- **Day 7:** ship one asset (a template pack or SOP) using the agent.

---

## 8) Upgrade Path (What Premium Adds)

Premium includes: - Full implementation-grade build guide (30–40 pages) - OpenClaw-first setup path (files + routines + governance) - SOP templates (daily/weekly/experiment/publishing approvals) - Troubleshooting (failure modes + fixes) - Full test suite (20 scenarios + scoring)

**If you want the complete system + templates, upgrade to Premium.**
